Oracle Primavera Cloud Service

As the name suggests, Oracle Primavera Cloud Service – formerly known as 'Prime' – is a fully cloud-based project and portfolio management solution comprising tools that allow executives, project members and field users to deliver projects and portfolios effectively, efficiently and with confidence. It's one of the newest products in the Oracle Primavera arsenal, but it's already making its mark by allowing project management, cost management and risk management team members in the field and in the office to collaborate seamlessly via the one simple solution.

Overview

For the Project Management professional, Oracle Primavera Cloud Service provides a set of tools to effectively manage simple to complex projects within a single platform. Oracle Primavera Cloud Service capabilities allow organisations to perform scope management, schedule management, cost management, resource management, risk management and document collaboration all within one software solution. In addition, Oracle Primavera Cloud Service enables portfolio managers, executives, stakeholders and project managers to work efficiently at portfolio level to prioritise and select projects in a collaborative manner, using KPIs, scenarios, scenario comparisons and budget planning to determine which projects to undertake during the planning cycle.
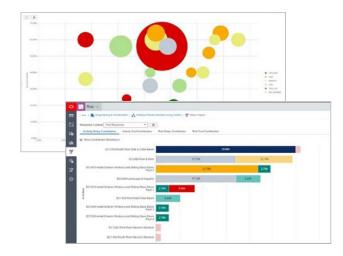

Many companies have three separate departments working in three disparate tools, feeding into the same project. Planners and schedulers, focussed on time

constraints, might be working in Oracle Primavera P6; cost estimators are likely to be using dedicated estimating tools to track and forecast costs while risk managers in a separate part of the business have their own specialist tools again. How can they be sure they are all working with the same data set? Oracle Primavera Cloud Service offers a comprehensive software solution to take the guesswork out of the situation, transforming the efficiency of project and portfolio management processes and revolutionising the accuracy of your reporting and forecasting.

Features

- Project and portfolio schedule management, including work breakdown structure, activities, resource assignment, scheduling and more

- Scope management, including planning, tracking and statusing

- Project cost management

- Resource management at Enterprise level

- Project and portfolio selection and management

- Risk management and analysis

- Project collaboration

- Document collaboration

- Portfolio Planning

- Integration with Oracle's Primavera P6 Enterprise Project Portfolio Management connects CPM scheduling with Oracle Primavera Cloud's lean task management

- Boost efficiency, visibility, and control in Lean construction processes. Define, coordinate, and manage tasks with digital planning boards. Monitor performance and integrate with the CPM master schedule

- Out-of-the-box deployment ideal for situations that require little or no custom modification

Benefits

- Effectively manage simple to complex projects within a single platform

- Enterprise level Resource Management solution allows project managers to utilise company resources effectively by leveraging capabilities such as levelling and resource analysis

- Interacts with various modules of the project to provide a single user interface to manage project cost, including forecast information

- Cloud-based Risk Management solution provides project managers and risk specialists with the information required to leverage qualitative and quantitative risk analysis

- Risk registers and Monte Carlo simulation capabilities allow risk managers to analyse and mitigate project risk, confident that they are fully informed at all times

- Holding the risk register in a central location gives immediate visibility to all concerned, aiding the identification, assessment, categorisation and statusing of project risks and supporting the effective creation of response plans

- Pre-built Histogram and Tornado charts based on Monte Carlo analysis techniques create clear, visual

reports for pre- and post-response analysis, giving quantitative visibility into the likelihood of meeting project or activity dates

- Built-in document management solution allows project team members and personnel to communicate and collaborate effectively via documents

- Purpose built planning solution helps portfolio managers determine which projects to undertake during a planning cycle

- KPIs, scenarios, scenario comparisons and budget planning capabilities allow planners to prioritise and select projects

- Fully cloud-based solution allows disparate teams to collaborate seamlessly

- Streamline Lean construction task management and improve project team coordination and delivery

- Out-of-the-box functionality makes install and deployment simple
